# **AMENDMENTS TO THE CLAIMS:**

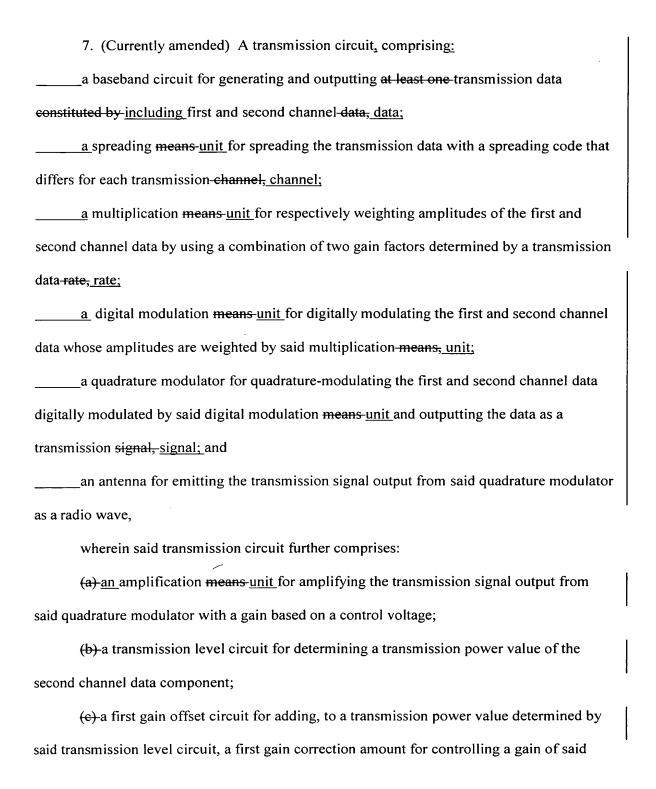

1. (Currently amended) A transmission circuit, comprising:
a baseband circuit for generating and outputting at least one transmission data
constituted by including first and second channel data, data;
a spreading means unit for spreading the transmission data with a spreading code that
differs for each transmission-channel; channel;
a multiplication means unit for respectively weighting amplitudes of the first and
second channel data by using a combination of two gain factors determined by a transmission
data-rate, rate;
a digital modulation means unit for digitally modulating the first and second channel
data whose amplitudes are weighted by said multiplication means, unit; and
a quadrature modulator for quadrature-modulating the first and second channel data
digitally modulated by said digital modulation means unit and outputting the data as a
transmission signal, and an antenna for emitting the transmission signal output from said
quadrature modulator as a radio wave, wherein:
wherein-said multiplication means-unit weights the amplitudes of the first and second
channel data by using gain factors that keep power of the transmission signal output from said
quadrature modulator constant regardless of the transmission data rate without changing a
ratio of a combination of gain factors determined by the transmission data rate, and
said multiplication unit weights the amplitudes of the first and second channel data by
using gain factors determined on the basis of the power of the transmission signal output from
said quadrature modulator without changing the ratio of the combination of gain factors
determined by the transmission data rate.

## 2. (Canceled)

- 3. (Currently amended) A transmission circuit as claimed in claim 1, wherein said multiplication means unit weights the amplitudes of the first and second channel data by using gain factors that make a sum of a square of a gain factor for weighting the amplitude of the first channel data and a square of a gain factor for weighting the amplitude of the second channel data constant regardless of the transmission data rate without changing a the ratio of a the combination of gain factors determined by the transmission data rate.
- 4. (Currently amended) A transmission circuit as claimed in claim 1, wherein said baseband circuit comprises a table storing a gain factor determined by the transmission data rate and a gain factor used by said multiplication means unit to weight the transmission data, and outputs a gain factor corresponding to the transmission data rate from said table to said multiplication means unit on the basis of the transmission data rate.

### 5. (Canceled)

6. (Currently amended) A transmission circuit as claimed in claim 3, wherein said baseband circuit comprises a table storing a gain factor determined by the transmission data rate and a gain factor used by said multiplication means-unit to weight the transmission data, and outputs a gain factor corresponding to the transmission data rate from said table to said multiplication means-unit on the basis of the transmission data rate.

amplification means unit to keep transmission power of the second channel data component at the antenna end constant regardless of the transmission data rate by using a combination of two gain factors determined by the transmission data rate, and outputting the transmission power value; and

(d) a voltage generating circuit for generating a voltage for controlling the gain of said amplification means unit, on the basis of the transmission power value output from said first gain offset circuit, and

wherein said antenna emits the transmission signal output from said quadrature modulator and amplified by said amplification means unit as a transmission signal.

8. (Currently amended) A transmission circuit as claimed in claim-4\_31, wherein:

said baseband circuit comprises a table storing a gain factor determined by the

transmission data rate and a gain factor used by said multiplication unit to weight the

transmission data, and outputs a gain factor corresponding to the transmission data rate from said table to said multiplication unit on the basis of the transmission data rate, and

\_\_\_\_\_said transmission circuit further comprises:

(a) an amplification means unit for amplifying the transmission signal output from said quadrature modulator with a gain based on a control voltage;

(b) a transmission level circuit for determining a transmission power value of the second channel data component;

(e) a first gain offset circuit for adding, to a transmission power value determined by said transmission level circuit, a first gain correction amount for controlling a gain of said amplification means-unit to keep transmission power of the second channel data component

at the antenna end constant regardless of the transmission data rate by using a combination of two gain factors determined by the transmission data rate, and outputting the transmission power value; and

(d) a voltage generating circuit for generating a voltage for controlling the gain of said amplification means unit, on the basis of the transmission power value output from said first gain offset circuit, and

wherein said antenna emits the transmission signal output from said quadrature modulator and amplified by said amplification means unit as a transmission signal.

## 9. (Canceled)

10. (Currently amended) A transmission circuit as claimed in claim-6\_31, wherein:

said multiplication unit weights the amplitudes of the first and second channel data by

using gain factors that make a sum of a square of a gain factor for weighting the amplitude of

the first channel data and a square of a gain factor for weighting the amplitude of the second

channel data constant regardless of the transmission data rate without changing the ratio of

the combination of gain factors determined by the transmission data rate,

said baseband circuit comprises a table storing a gain factor determined by the

transmission data rate and a gain factor used by said multiplication unit to weight the

transmission data, and outputs a gain factor corresponding to the transmission data rate from

said table to said multiplication unit on the basis of the transmission data rate, and

said transmission circuit further comprises:

(a)-an amplification means unit for amplifying the transmission signal output from

said quadrature modulator with a gain based on a control voltage;

(b) a transmission level circuit for determining a transmission power value of the second channel data component;

(e) a first gain offset circuit for adding, to a transmission power value determined by said transmission level circuit, a first gain correction amount for controlling a gain of said amplification means unit to keep transmission power of the second channel data component at the amplitude antenna end constant regardless of the transmission data rate by using a combination of two gain factors determined by the transmission data rate, and outputting the transmission power value; and

(d) a voltage generating circuit for generating a voltage for controlling the gain of said amplification means-unit on the basis of the transmission power value output from said first gain offset circuit, and

wherein said antenna emits the transmission signal output from said quadrature modulator and amplified by said amplification means unit as a transmission signal.

- 11. (Original) A transmission circuit as claimed in claim 7, wherein said first gain offset circuit calculates transmission power of the first channel data component by using a combination of two gain factors determined by the transmission data rate, adds the transmission power as the first gain correction amount to the transmission power value determined by said transmission level circuit, and outputs the transmission power value.
- 12. (Original) A transmission circuit as claimed in claim 8, wherein said first gain offset circuit calculates transmission power of the first channel data component by using a

combination of two gain factors determined by the transmission data rate, adds the transmission power as the first gain correction amount to the transmission power value determined by said transmission level circuit, and outputs the transmission power value.

### 13. (Canceled)

- 14. (Original) A transmission circuit as claimed in claim 10, wherein said first gain offset circuit calculates transmission power of the first channel data component by using a combination of two gain factors determined by the transmission data rate, adds the transmission power as the first gain correction amount to the transmission power value determined by said transmission level circuit, and outputs the transmission power value.
- 15. (Currently amended) A transmission circuit as claimed in claim 7, further comprising a second gain offset circuit for adding, to the transmission power value output from said first gain offset circuit, a second gain correction amount which is used to correct an output power error caused in said quadrature modulator when said multiplication means-unit weights the amplitudes of the first and second channel data by using gain factors for weighting the amplitudes,

wherein said voltage generating circuit generates a voltage for controlling the gain of said amplification-means unit, on the basis of the transmission power value output from said second gain offset circuit.

16. (Currently amended) A transmission circuit as claimed in claim 8, further

comprising a second gain offset circuit for adding, to the transmission power value output from said first gain offset circuit, a second gain correction amount which is used to correct an output power error caused in said quadrature modulator when said multiplication means unit weights the amplitudes of the first and second channel data by using gain factors for weighting the amplitudes,

wherein said voltage generating circuit generates a voltage for controlling the gain of said amplification-means unit, on the basis of the transmission power value output from said second gain offset circuit.

### 17. (Canceled)

18. (Currently amended) A transmission circuit as claimed in claim 10, further comprising a second gain offset circuit for adding, to the transmission power value output from said first gain offset circuit, a second gain correction amount which is used to correct an output power error caused in said quadrature modulator when said multiplication means unit weights the amplitudes of the first and second channel data by using gain factors for weighting the amplitudes,

wherein said voltage generating circuit generates a voltage for controlling the gain of said amplification—means unit, on the basis of the transmission power value output from said second gain offset circuit.

19. (Currently amended) A transmission circuit as claimed in claim 15, wherein said second gain offset circuit calculates a ratio between output power of said quadrature

modulator set when one combination of gain factors of gain factors used to weight the amplitudes of the first and second channel data by said multiplication means-unit is set as a reference combination, and the reference combination of gain factors are used, and output power of said quadrature modulator set when gain factors used to weight the amplitudes of the first and second channel data by said multiplication means-unit are used, adds the ratio as the second gain correction amount to the transmission power output from said first gain offset circuit, and outputs the transmission power.

20. (Currently amended) A transmission circuit as claimed in claim 16 wherein said second gain offset circuit calculates a ratio between output power of said quadrature modulator set when one combination of gain factors of gain factors used to weight the amplitudes of the first and second channel data by said multiplication means unit is set as a reference combination, and the reference combination of gain factors are used, and output power of said quadrature modulator set when gain factors used to weight the amplitudes of the first and second channel data by said multiplication means unit are used, adds the ratio as the second gain correction amount to the transmission power output from said first gain offset circuit, and outputs the transmission power.

## 21. (Canceled)

22. (Currently amended) A transmission circuit as claimed in claim 18 wherein said second gain offset circuit calculates a ratio between output power of said quadrature modulator set when one combination of gain factors of gain factors used to weight the

Serial No. 10/020,186

Docket No. SON-0521 US

SUZ.023

amplitudes of the first and second channel data by said multiplication means-unit is set as a

reference combination, and the reference combination of gain factors are used, and output

power of said quadrature modulator set when gain factors used to weight the amplitudes of

the first and second channel data by said multiplication means unit are used, adds the ratio as

the second gain correction amount to the transmission power output from said first gain offset

circuit, and outputs the transmission power.

23. (Currently amended) A transmission circuit as claimed in claim 19, wherein said

second gain offset circuit includes a table storing a gain factor determined by the transmission

data rate and a gain factor used by said multiplication means unit to weight the transmission

data.

24. (Currently amended) A transmission circuit as claimed in claim 20, wherein said

second gain offset circuit includes a table storing a gain factor determined by the transmission

data rate and a gain factor used by said multiplication means-unit to weight the transmission

data.

25. (Canceled)

26. (Currently amended) A transmission circuit as claimed in claim 22, wherein said

second gain offset circuit includes a table storing a gain factor determined by the transmission

data rate and a gain factor used by said multiplication means-unit to weight the transmission

data.

12

27. (Original) A transmission circuit as claimed in claim 1, wherein the first channel data is data channel data of the transmission data, and

the second channel data is control channel data of the transmission data.

28. (Original) A transmission circuit as claimed in claim 7, wherein the first channel data is data channel data of the transmission data, and

the second channel data is control channel data of the transmission data.

- 29. (Currently amended) A transmission circuit as claimed in claim 1, wherein said digital modulation means is unit comprises a phase modulation means unit for phase shifting modulating amplitude data of the first and second channel data whose amplitudes are weighted by said multiplication—means unit.
- 30. (Currently amended) A transmission circuit as claimed in claim 7, wherein said digital modulation means is unit comprises a phase modulation means unit for phase shifting modulating amplitude data of the first and second channel data whose amplitudes are weighted by said multiplication means unit.
- 31. (New) A transmission circuit as claimed in claim 1, further comprising an antenna for emitting the transmission signal output from said quadrature modulator as a radio wave.
